The ice cream parlor "Enjoy-Cream" has faced challenges in the efficient management of its employees. The current administration lacks a structured system to identify, organize, and assign responsibilities to the eight employees who are part of the team. Additionally, the absence of a centralized database has led to difficulties in monitoring performance, scheduling shifts, and managing employees' personal information.

The ice cream parlor is seeking an effective and organized solution to address these issues through the design and implementation of a database. The goal is to develop a system that allows easy access to relevant information about each employee, as well as to improve task assignment and shift planning. With two daily shifts of 8 hours each, where four employees work in the first shift and another four in the second, the aim is to ensure coverage for most of the day.
